Programming Tasks:

1. Partition an array into two parts

Implement a method Partition declared below to divide a given array A into two parts. $j(j \ge 0)$ is the index of the pivot, put all elements < pivot to the left, elements \ge pivot to the right side.

```
template<typename T>
int Partition(array<T> A, int j,...) {
    //...
}
```

2. Non-randomized Quicksort

Implement a quick-sort algorithm *Quicksort* and take the last element in the array as pivot. Using *Partition* defined above as its subroutine.

```
template<typename T>
void Quicksort (array<T> A,...) {
//...
}
```

3. Random Selection Algorithm

Implement a method Rselect to find i-th (i > 0) smallest item of the given array A. Choose the pivot from A uniformly at random. The pseudocode is given below.

```
template<typename T>
T Rselect(array<T> A, int i, ....) {
   if only one element in A return A[0];
   Choose pivot p from array A uniformly at random;
   Partition A using pivot p;
   Let j be the index of p;
   if(j == i) return p;
   if(j > i) return Rselect(1st part of A,i,...);
   else return Rselect(2nd part of A,i-j,...);
}
```

4. Deterministic Selection Algorithm

Implement a method Dselect using deterministic selection algorithm to find the i-th (i > 0) smallest item of array A. The pivot is chosen by following steps

- (a) Break A into n/5 groups of size 5 each
- (b) Sort each group (e.g., use insertion sort, merge sort ...)
- (c) Copy n/5 medians into new array C

- (d) Recursively compute median of C by calling the deterministic selection algorithm
- (e) Return the median of C as pivot

The pseudocode of *Dselect* is as follows

```
template<typename T>
 T Dselect (array<T> A, int i, ....) {
      if(only one element in A) return A[0];
      //ChoosePivot
      Break A into groups of 5, sort each group;
      C = n/5 \text{ medians};
      p = Dselect(C, n/10, ...); //return the median value in C
      //Partition
      Partition A using pivot p;
      Let j be the index of p;
11
      if(j == i) return p;
      if(j > i) return Dselect(1st part of A, i, ...);
13
      else return Dselect (2nd part of A, i-j, ...);
14
```

5. Complete main function

The main.cpp is given by us, try to follow the instructions in it to test your functions.

Important Notes:

- **Reference**: The class note of Lecture 7.
- Make sure your program won't crash if the input array is **empty**.
- Remember to submit your **makefile!**
- Due: 2019/10/26 11:59pm
